Deefinity Weather Mail Docker App Documentation

Overview

This document provides instructions on how to pull and run the Deefinity Weather Mail application using Docker.

Prerequisites

- Ensure you have Docker installed on your machine. You can download it from Docker's official website.

Instructions

1. **Pull the Docker Image**

   Open your terminal and run the following command to pull the Deefinity Weather Mail Docker image:

   docker pull fnaem/deefinityweathermail

2. **Run the Docker Container**

   Once the image is pulled, you can run the container with the following command:

   docker run -d -p 8000:8000 fnaem/deefinityweathermail:latest

   o   The -d flag runs the container in detached mode.

   o   The -p 8000:8000 option maps port 8000 of your local machine to port 8000 of the container.

3. **Access the Application**

   After running the container, the application will be available at:

   http://localhost:8000

Conclusion

You have successfully pulled and run the Deefinity Weather Mail application using Docker.
